Cybersecurity Solutions

Protecting Connected Systems from the Inside Out

Bilvatech provides cybersecurity solutions designed to protect embedded, connected, and mission-critical systems throughout their operational lifecycle. We approach security at the platform and application level, helping organizations identify vulnerabilities, strengthen system configurations, protect sensitive information, and control access to critical resources.

Our solutions are designed to build security into the system architecture from the beginning rather than treating cybersecurity as an additional layer after development.

What We Provide

Secure System Architecture
Bilvatech helps design security-focused system architectures with clearly defined trust boundaries, access controls, and protection mechanisms. This helps reduce exposure and creates a stronger foundation for connected and embedded products.

Device & User Authentication
We implement mechanisms that establish trusted device identities and control access to system resources, helping ensure that only authorized devices, applications, and users can interact with protected functions.

Data Protection & Encryption
We help protect sensitive information through encryption and secure data-handling mechanisms, covering information stored on devices as well as data exchanged between systems and connected endpoints.

Secure Boot & Platform Integrity
Bilvatech can implement secure boot mechanisms that verify authorized software before allowing a system to execute. This helps protect the device from unauthorized software and supports a trusted software foundation from startup.

Vulnerability Management
We help identify and address software vulnerabilities across embedded platforms and their supporting components. Our approach can include vulnerability assessment, security updates, configuration improvements, and ongoing monitoring.

Secure Software Updates
We provide mechanisms for authenticated and controlled software updates, helping organizations deliver new functionality and security fixes while reducing the risk of unauthorized or compromised software being installed.

Security Monitoring & Audit
Our solutions can incorporate logging and monitoring capabilities that provide visibility into security-related events, access attempts, and system activity, supporting faster investigation and response.

Security Across the Product Lifecycle

Cybersecurity requirements continue beyond the initial development stage. Bilvatech supports security throughout the lifecycle—from **architecture and development to deployment, updates, vulnerability management, and ongoing maintenance**.

Our cybersecurity capabilities are suited for **industrial systems, IoT devices, embedded platforms, automotive applications, critical infrastructure, defense systems, and other connected environments** where protecting devices, data, and system operations is essential.

Security engineered into the platform. Protection built for the lifecycle.
